

# How much light energy can be stored

## Overview

---

We can store cold (ice), heat (i.e. hot water bag) and electrical charge (batteries). We can even "store" a magnetic field in a magnet. We can convert light into energy and then, if we want, back to light. But we can't store light in form of light in significant. Why can't we store light in the form of light?

We can store cold (ice), heat (i.e. hot water bag) and electrical charge (batteries). We can even "store" a magnetic field in a magnet. We can convert light into energy and then, if we want, back to light. But we can't store light in form of light in. Random idea just popped into my mind - since we've developed fibre optics - a way of transmitting data by sending light patterns with energy loss close to 0 - why can't we use principles such as TIR (total internal reflection) to collect large amounts of light (sunlight) and then store it similar. The photosynthetic efficiency (i.e. oxygenic photosynthesis efficiency) is the fraction of light energy converted into chemical energy during photosynthesis in green plants and algae. Photosynthesis can be described by the simplified chemical reaction where  $C_6H_{12}O_6$  is glucose (which is. Students learn how to estimate the "energy efficiency" of photosynthesis, or the amount of energy that plants absorb for any given location on Earth. This is the ratio of the amount of energy stored to the amount of light energy absorbed and is used to evaluate and model photosynthesis efficiency. The speed of light is  $300,000$  km/sec. So  $100$  km takes  $1/3$  of a millisecond. At this time, half the energy is still stored. After another  $1/3$  millisecond, there is  $1/4$  of the light left. Another, and there is  $1/8$  of it. Total time so far:  $1$  millisecond. You can't store light for any. Abstract: This article discusses how light could be stored, so that you can take it with you and use it at some later time. These thoughts very nicely show you how a laser works. ## Is it possible to 'store' light so it can be used as a form of energy

Basically, any interaction with light causes losses so for now the better option is to store other forms of energy using light as an input, such as solar panels.
